

KV Cache Policy Experiment on A40

Red - full context

Blue - current exact

Orange - bucketed

500m model, draft_len=4

- Unique compile keys seen:
 - Red/full: 1
 - Blue/current exact: 8
 - Orange/bucketed: 5
- Mean steady TPS:
 - Red/full: 153.834
 - Blue/current exact: 251.554
 - Orange/bucketed: 251.974

3b model, draft_len=16

- Unique compile keys seen:
 - Red/full: 1
 - Blue/current exact: 8
 - Orange/bucketed: 5
- Mean steady TPS:
 - Red/full: 134.973
 - Blue/current exact: 169.123
 - Orange/bucketed: 173.650

Notes

- Primary comparison metric is steady decode TPS (steady_tokens_per_second_mean), i.e. compile excluded.
- Blue/current exact gives the most shape variants (one per required_len point in this sweep).
- Orange bucketed reduces shape variants while keeping steady throughput near or above blue in this matrix.
